

Image Distortion

A client had a blog. This blog's posts had images added by the blog's rich text editor.

As blogs go, the entries piled up over the years. The text editor worked flawlessly each time.

Images were the size they were supposed to be, and the text flowed where it was supposed to.

Then, the images would appear to behave differently outside the editor. No amount of image adjustment translated to the published post. The blog editor edits the css behind the scenes. The editor was somehow broken. CSS is a rule set which tells the browser where to place elements and how they would appear.

Without getting into the language's rules,

I'll try to explain.

A page is made of elements.

Example: images, links, text ect.

Each element has a list of attributes.

Example: `<image. src=bla.jpg. height=1080px>`

Image is the element. Src and height are attributes.

Basically, instead of writing out the attributes inside every element, you just give the element a name, and everything under that name inherits those attributes.

So if now you want to make all 4000000000 images smaller, you just change one line and everything under that name magically changes size. That's the magic of css

To fix your problem, we'll just have to give all those images a name and write one rule for size and your distortion problems will be over. As a learning experience, I could walk you through it, or if you'd like me to just fix it and walk you through it at a more convenient time, that's also possible.

However if time isn't an object, just follow the link and find the image section. Applying it to shopify is pretty straight forward after. I could walk you through that too.

If you need anything, please let me know.
